In fluids, the flow velocity varies linearly at different points, being 0 at the bottom, and a velocity 'u' in the top. The force F acting on the fluid particles is directly proportional to the fluid velocity 'u' and the area 'A' of the layer and is inversely proportional to the distance 'y' between them.

Answer: In lyophilic sols, there is a strong interaction between the dispersed phase and dispersion medium, highly stable and resistant to coagulation. Lyophobic sols are unstable weak unstable Van Der Waals forces of attraction between dispersed phase and dispersion medium due to these forces these are irreversible and ready to coagulate. 2.
