(publ. George Allen & Unwin) Evolution: The Modern Synthesis, a popularising 1942 book by Julian Huxley (grandson of T.H. Huxley), set out his vision of the modern synthesis of evolutionary biology of the mid-20th century. It was enthusiastically reviewed in academic biology journals.

Evolution: The Modern Synthesis - Wikipedia

The Modern Synthesis was the early 20th-century synthesis reconciling Charles Darwin's theory of evolution and Gregor Mendel's ideas on heredity in a joint mathematical framework. Julian Huxley coined the term in his 1942 book, Evolution: The Modern Synthesis.. The 19th century ideas of natural selection and Mendelian genetics were put together with population genetics, early in the twentieth ...

Modern synthesis (20th century) - Wikipedia

Modern Synthesis The Modern Synthesis describes the fusion (merger) of Mendelian genetics with Darwinian evolution that resulted in a unified theory of evolution. It is sometimes referred to as the Neo-Darwinian theory. The Modern Synthesis was developed by a number of now-legendary evolutionary biologists in the 1930s and 1940s.

The “modern synthesis” generally refers to the early to mid-century formulation of evolutionary theory that reconciled classical Darwinian selection theory with a newer population-oriented view of Mendelian genetics that attempted to explain the origin of biological diversity.

The Modern Synthesis - Evolutionary Biology - Oxford ...

In other words, the Modern Synthesis is a theory about how evolution works at the level of genes, phenotypes, and populations whereas Darwinism was concerned mainly with organisms, speciation and individuals. This is a major paradigm shift and those who fail to appreciate it find themselves out of step with the thinking of evolutionary biologists.

The Modern Synthesis of Genetics and Evolution

Ever since the Evolutionary Synthesis of the 1930s and 1940s, some biologists have expressed doubt that the Synthetic Theory [the prevailing modern version of evolution, also called neo-Darwinism], based principally on mutation, genetic variation, and natural selection, adequately accounts for macroevolution, or evolution above the species level. 1
